Introduct	ion				

- The concept of duality is a powerful tool for the description, analysis, and construction of algorithms. This is because duality allows us to look at the problem from different angle.
- In this lecture we explore how geometric duality can be used to design efficient algorithms by considering a number of problems in computational geometry.
- For simplicity, we consider duality in two dimensions only. However, the concept generalizes to higher dimensions also.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Introductio	on				

In the Cartesian plane, a point has two parameters (x- and y-coordinates) and a (non-vertical) line also has two parameters (slope and y-intercept). We can thus map a set of points to a set of lines, and vice versa, in an one-to-one manner.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Introductio	on				

- In the Cartesian plane, a point has two parameters (x- and y-coordinates) and a (non-vertical) line also has two parameters (slope and y-intercept). We can thus map a set of points to a set of lines, and vice versa, in an one-to-one manner.
- This natural duality between points and lines in the Cartesian plane has long been known to geometers.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Introduction	on				

• There are many different point-line duality mappings possible, depending on the conventions of the standard representations of a line.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Introductio	on				

- There are many different point-line duality mappings possible, depending on the conventions of the standard representations of a line.
- Each such mapping has its advantages and disadvantages in particular contexts.

Introduction

- 2 Definition and Properties
- 3 Convex Hull
- Arrangement of Lines
- 5 Smallest Area Triangle
- 6 Nearest Neighbor of a Line

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Definition					

Let D be the duality transformation.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Definition					

Let *D* be the duality transformation.

Definition

A point p(a, b) is transformed to the line $D_p(y = ax - b)$.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Definition					

Let D be the duality transformation.

Definition

A point p(a, b) is transformed to the line $D_p(y = ax - b)$.

Definition

A line I(y = cx + d) is transformed to the point $D_I(c, -d)$.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Observat	ions				

Observation

D is its own inverse, that is, $DD_p = p$ and $DD_l = l$.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Observati	ions				

Observation

D is its own inverse, that is, $DD_p = p$ and $DD_l = l$.

Observation

D is not defined for vertical lines since vertical lines can not be represented in the form y = mx + c.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Observati	ions				

Observation

D is its own inverse, that is, $DD_p = p$ and $DD_l = l$.

Observation

D is not defined for vertical lines since vertical lines can not be represented in the form y = mx + c.

However this is not a problem in general. Because we can always rotate the problem space slightly so that no line is vertical. Sometimes, vertical lines are taken as special cases and treated separately.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Properties					

Incidence is preserved

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Properties					

Incidence is preserved

Lemma

A point p(a, b) is incident to the line l(y = cx + d) in the primal plane iff point $D_l(c, -d)$ is incident to the line $D_p(y = ax - b)$ in the dual plane.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Properties					

But order is reversed

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Properties					

But order is reversed

Lemma

A point p(a, b) is above (below) the line l(y = cx + d) in the primal plane iff line $D_p(y = ax - b)$ is below (above) the point $D_l(c, -d)$ in the dual plane.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Example3					

 $h = \frac{d(D_l, \alpha)}{\sqrt{1 + (x(D_l))^2}}$

Here d(.,.) is distance between two points. And x(.) is x-coordinate of a point.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Alternative	e Definition				

• The duality transformation we have described so far is often called m-c duality.

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Alternative	e Definiti	on			

- The duality transformation we have described so far is often called m-c duality.
- There are variations of m-c duality. For example, a variation of m-c duality is: $p(a, b) \rightarrow D_p(y = ax + b)$ and $l(y = cx + d) \rightarrow D_l(-c, d)$. Observe that, here $DD_p \neq p$ and $DD_l \neq l$, but both incidence and order are preserved.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Alternative	e Definiti	on			

- The duality transformation we have described so far is often called m-c duality.
- There are variations of m-c duality. For example, a variation of m-c duality is: $p(a, b) \rightarrow D_p(y = ax + b)$ and $l(y = cx + d) \rightarrow D_l(-c, d)$. Observe that, here $DD_p \neq p$ and $DD_l \neq l$, but both incidence and order are preserved.

• An alternative definition, called polar duality, is also used.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Polar Dua	ality				

Definition

A point *p* with coordinates (a, b) in the primal plane corresponds to a line T_p with equation ax + by + 1 = 0 in the dual plane and vice versa.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Polar Du	ality				

 Geometrically this means that if d is the distance from the origin(O) to the point p, the dual T_p of p is the line perpendicular to Op at distance 1/d from O and placed on the other side of O.

Optimal	Algorithms	5			

• By reducing the sorting problem to the convex hull problem, it can be shown that the worst case computational complexity of the convex hull problem is $O(n \log n)$, where n is the size of the given point set.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Optimal	Algorithms	5			

• By reducing the sorting problem to the convex hull problem, it can be shown that the worst case computational complexity of the convex hull problem is $O(n \log n)$, where n is the size of the given point set.

• A number of optimal algorithms have been devised for the convex hull problem.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Optimal	Algorithms	5			

- Grahams scan, time complexity O(nlogn). (Graham, R.L., 1972)
- Divide and conquer algorithm, time complexity O(nlogn). (Preparata, F. P. and Hong, S. J., 1977)
- Jarvis's march or gift wrapping algorithm, time complexity O(nh) where *h* number of vertices of the convex hull. (Jarvis, R. A., 1973)
- Most efficient algorithm to date is based on the idea of Jarvis's march, time complexity O(nlogh).

T. M. Chan (1996)

• We now develop an optimal algorithm for computing convex hull using the concept of duality.

Connection	Between	Hull and	l Envelope		

Introduction Definitions Hull Arrangement Triangle Nearest Neighbor Connection Between Hull and Envelope

Conclusion

Upper hull (lower hull) in primal plane corresponds to the lower envelope (upper envelope) in the dual plane.

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Introduction Definitions Hull Arrangement Triangle Nearest Neighbor Connection Between Hull and Envelope

Conclusion

Upper hull (lower hull) in primal plane corresponds to the lower envelope (upper envelope) in the dual plane.

Thus the problem of computing convex hull of a point set in the primal plane reduces to the problem of computing upper and lower envelopes of the corresponding set of lines in the dual plane.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Result					

Lemma

After sorting n lines by their slopes in O(nlogn) time, the upper envelope can be obtained in O(n) time.

Proof.

It may check more than one line segment when inserting a new line, but those ones checked are all removed except the last one. $\hfill\square$

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Result					

Theorem

Let \mathcal{L} be the set of n lines in the plane, and let $A(\mathcal{L})$ be the arrangement induced by \mathcal{L} .

- (i) The number of vertices of $A(\mathcal{L})$ is at most n(n-1)/2.
- (ii) The number of edges of $A(\mathcal{L})$ is at most n^2 .

(iii) The number of faces of $A(\mathcal{L})$ is at most $n^2/2 + n/2 + 1$.

Equality holds in these three statements iff $A(\mathcal{L})$ is simple.

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Result					

Theorem

Let \mathcal{L} be the set of n lines in the plane, and let $A(\mathcal{L})$ be the arrangement induced by \mathcal{L} .

- (i) The number of vertices of $A(\mathcal{L})$ is at most n(n-1)/2.
- (ii) The number of edges of $A(\mathcal{L})$ is at most n^2 .
- (iii) The number of faces of $A(\mathcal{L})$ is at most $n^2/2 + n/2 + 1$.

Equality holds in these three statements iff $A(\mathcal{L})$ is simple.

Can be proved easily by using Euler's formula: For any connected planner embedded graph with m_v vertices, m_e edges, and m_f faces the following relation holds

$$m_v - m_e + m_f = 2.$$

Introduction	Definitions	Hull	Arrangement	Triangle	Nearest Neighbor
Point Location Using Level Structure					

- First compute the levels of the arrangement $A(\mathcal{L})$ in $O(n^2 \log n)$ time using $O(n^2)$ space.
- Let λ_θ be the linear array containing vertices and edges of level θ, θ = 0, 1, ..., (n − 1), of the arrangement A(L).

 Create a balanced binary search tree T, called the primary structure, whose nodes correspond to the levels θ , $0 \le \theta < n$. Each node of T, representing a level θ , is attached with the corresponding array λ_{θ} , called the secondary structure. This construction requires $O(n \log n)$ time and O(n) space.

 Create a balanced binary search tree T, called the primary structure, whose nodes correspond to the levels θ , $0 \le \theta < n$. Each node of T, representing a level θ , is attached with the corresponding array λ_{θ} , called the secondary structure. This construction requires $O(n \log n)$ time and O(n) space.

• Given the query line *I*, we perform two level binary search on the tree *T* with the point *D*_{*I*}.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- Given the query line *I*, we perform two level binary search on the tree *T* with the point *D*₁.
- This will enable us to locate the two edges just above and below *D*₁.

- Given the query line *I*, we perform two level binary search on the tree *T* with the point *D*₁.
- This will enable us to locate the two edges just above and below *D*₁.
- Time complexity for performing this point location is $O(\log^2 n)$.

Complexi	ty				

Lemma

With $O(n^2 \log n)$ preprocessing time and $O(n^2)$ space, nearest neighbor of a non-vertical query line can be determined in $O(\log^2 n)$ time.

It may be mentioned that the query time complexity can be reduced to O(log n), by using a data structuring technique, called fractional cascading.
