## The line of proof:

- The interior of a cell lies outside  $P_G(S)$  if and only if the cell has no object occupancy.
- All vertices are detected and correctly classified.
- If  $p$  is a point lying on  $P_G(S)$ , then  $0 < d_T(p, S) \leq g$ .
- The construction of  $P_G(S)$  always concludes at the start vertex.

## Runtime:<sup>1</sup>

- Best case:  $O(|P|/g)$  ← found in practice
- Worst case:  $O(|P|)$

---

<sup>1</sup> $|P|$  = perimeter of  $P_G(S)$
